Apply filters to SQL queries

Project description

My organization is enhancing the security of its system. My responsibilities include ensuring system safety, investigating potential security issues, and updating employee computers as necessary. The following steps illustrate how I utilized SQL with filters to carry out security-related tasks.

Retrieve after hours failed login attempts

There was a potential security incident that occurred after business hours (after 18:00). All failed login attempts during this time need to be investigated.

The following code demonstrates how I created a SQL query to filter for failed login attempts that occurred after business hours:

```
MariaDB [organization]> SELECT
   -> FROM log_in_attempts
   -> WHERE login_time > '18:00' AND success = FALSE;
                       login_date | login_time | country | ip_address
                                                                              success
                                                                                    0
       2
                       2022-05-10
                                    20:27:27
                                                            192.168.205.12
           apatel
                                                 US
                                                                                    0
       18
           pwashing
                       2022-05-11
                                    19:28:50
                                                            192.168.66.142
                                                 MEXICO
```

The first part of the screenshot shows my query, while the second part displays a portion of the output. This query filters for failed login attempts that occurred after 18:00.

First, I selected all data from the log_in_attempts table. Then, I used a WHERE clause with an AND operator to refine my results, ensuring only login attempts that occurred after 18:00 and were unsuccessful are included. The first condition, login_time > '18:00', filters for login attempts after 18:00. The second condition, success = FALSE, filters for failed login attempts.

Retrieve login attempts on specific dates

A suspicious event occurred on 2022-05-09. Any login activity that happened on 2022-05-09 or the day before needs to be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that occurred on specific dates:

```
MariaDB [organization]> SELECT *
   -> FROM log_in_attempts
   -> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08';
event_id | username | login_date | login_time | country | ip_address
                                                                             success
       1 |
                      2022-05-09
                                    04:56:27
                                                CAN
                                                           192.168.243.140
                                                                                    0
           jrafael
       3
           dkot
                       2022-05-09
                                    06:47:41
                                                 USA
                                                           192.168.151.162
                                                                                    0
                                                 USA
            dkot
                       2022-05-08
                                    02:00:39
                                                           192.168.178.71
```

The first part of the screenshot shows my query, while the second part displays a portion of the output. This query returns all login attempts that occurred on 2022-05-09 or 2022-05-08.

First, I selected all data from the $log_in_attempts$ table. Then, I used a WHERE clause with an OR operator to refine my results, ensuring only login attempts that occurred on either 2022-05-09 or 2022-05-08 are included. The first condition, $login_date = '2022-05-09'$, filters for logins on 2022-05-09. The second condition, $login_date = '2022-05-08'$, filters for logins on 2022-05-08.

Retrieve login attempts outside of Mexico

After investigating the organization's data on login attempts, I believe there is an issue with the login attempts that occurred outside of Mexico. These login attempts should be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that occurred outside of Mexico:

```
MariaDB [organization]> SELECT *
   -> FROM log_in_attempts
   -> WHERE NOT country LIKE 'MEX%';
event id l
                       login_date | login_time | country | ip_address
                                                                             success
            jrafael
                       2022-05-09
                                                  CAN
                                                            192.168.243.140
                                                                                     0
        2
            apatel
                       2022-05-10
                                    20:27:27
                                                  CAN
                                                            192.168.205.12
                                                                                     0
                       2022-05-09 | 06:47:41
                                                            192.168.151.162
```

The first part of the screenshot shows my query, while the second part displays a portion of the output. This query returns all login attempts that occurred in countries other than Mexico.

First, I selected all data from the log_in_attempts table. Then, I used a WHERE clause with NOT to filter for countries other than Mexico. I used LIKE with the pattern MEX% because the dataset represents Mexico as both MEX and MEXICO. The percentage sign (%) represents any number of unspecified characters when used with LIKE.

Retrieve employees in Marketing

My team wants to update the computers for certain employees in the Marketing department. To do this, I need to gather information on which employee machines to update.

The following code demonstrates how I created a SQL query to filter for employee machines from employees in the Marketing department in the East building:

```
MariaDB [organization]> SELECT *
   -> FROM employees
   -> WHERE department = 'Marketing' AND office LIKE
 employee_id
             | device_id
        1000
               a320b137c219
                              elarson
                                          Marketing
                              jdarosa
        1052
               a192b174c940
                                          Marketing
                              fbautist
               x573y883z772
                                          Marketing
                                                        East-267
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all employees in the Marketing department in the East building. First, I started by selecting all data from the <code>employees</code> table. Then, I used a <code>WHERE</code> clause with <code>AND</code> to filter for employees who work in the Marketing department and in the East building. I used <code>LIKE</code> with <code>East%</code> as the pattern to match because the data in the <code>office</code> column represents the East building with the specific office number. The first condition is the <code>department = 'Marketing'</code> portion, which filters for employees in the Marketing department. The second condition is the <code>office LIKE 'East%'</code> portion, which filters for employees in the East building.

Retrieve employees in Finance or Sales

The machines for employees in the Finance and Sales departments also need to be updated. Since a different security update is needed, I have to get information on employees only from these two departments.

The following code demonstrates how I created a SQL query to filter for employee machines from employees in the Finance or Sales departments.

```
MariaDB [organization]> SELECT *
   -> FROM employees
   -> WHERE department = 'Finance' OR department = 'Sales';
 emplovee id
               device id
                              username
               d394e816f943
                               sgilmore
        1003
                                          Finance
                                                        South-153
               h174i497j413
                              wjaffrey
        1007
                                          Finance
                                                        North-406
               i858j583k571
        1008
                               abernard
                                          Finance
                                                        South-170
```

The first part of the screenshot is my query, and the second part is a portion of the output. This query returns all employees in the Finance and Sales departments. First, I started by selecting all data from the employees table. Then, I used a WHERE clause with OR to filter for employees who are in the Finance and Sales departments. I used the OR operator instead of AND because I want all employees who are in either department. The first condition is department = 'Finance', which filters for employees from the Finance department. The second condition is department = 'Sales', which filters for employees from the Sales department.

Retrieve all employees not in IT

My team needs to make one more security update on employees who are not in the Information Technology department. To make the update, I first have to get information on these employees.

The following demonstrates how I created a SQL query to filter for employee machines from employees not in the Information Technology department.

The first part of the screenshot shows my query, while the second part displays a portion of the output. The query returns all employees not in the Information Technology department.

First, I selected all data from the employees table. Then, I used a WHERE clause with NOT to filter for employees who are not in this department.

Summary

I applied filters to SQL queries to obtain specific information on login attempts and employee machines. I utilized two different tables: `log_in_attempts` and `employees`. I employed the `AND`, `OR`, and `NOT` operators to filter for the specific information required for each task. Additionally, I used `LIKE` with the percentage sign (`%`) wildcard to filter for patterns.
